

Lab 01 - Create the Video Production Contract and Research Backlog

Agentic AI for Video Creation | TGS-2023036088 | Version v2.0
Tertiary Infotech Academy Pte Ltd | UEN 201200696W

Objective

Turn the Harbour Bean brief into a governed production contract, claim-risk register and research queue.

Files and setup

File	Purpose
workflow.json	Importable n8n workflow with dry-run defaults
data/mock-data.xlsx	Synthetic inputs and validation sheet
evidence/checklist.md	Acceptance evidence to retain

Detailed execution

1. Open the workbook and confirm the highlighted input rows and the Validation sheet.
2. Import workflow.json into n8n and inspect the Lab Contract sticky note.
3. Check each node's input/output contract and verify there are no embedded secrets.
4. Insert the bounded prompt below only in the designated AI/tool-adapter node.
5. Run once with approved data and once with a deliberately blocked condition.
6. Retain the final execution evidence and complete the checklist.

Copy-ready bounded prompt

Act as a video production planner. Use only the supplied brief and backlog rows. Return JSON with run_id, audience, channel, duration_s, claims, constraints, approval_policy and missing_evidence. Mark status BLOCKED when a high-risk claim has no approved source.

Expected workflow path

Manual Trigger -> Load Brief -> Validate Contract -> Score Claim Risk -> Create Research Backlog -> Write Checkpoint

Acceptance criterion

READY is emitted only when all 18 production-contract fields are present and every high-risk claim has a research owner.

Safety and release control

Use synthetic or authorized content. Store credentials in n8n credentials, never in workflow JSON. Human approval must bind to the exact payload hash. Keep publishing dry-run/private until the trainer authorizes a controlled demonstration.
