

Lab 02 - Run Evidence Research and Build the Claim Register

Agentic AI for Video Creation | TGS-2023036088 | Version v2.0
Tertiary Infotech Academy Pte Ltd | UEN 201200696W

Objective

Score sources, extract bounded evidence and approve only claims that can be traced to a retrievable source.

Files and setup

File	Purpose
workflow.json	Importable n8n workflow with dry-run defaults
data/mock-data.xlsx	Synthetic inputs and validation sheet
evidence/checklist.md	Acceptance evidence to retain

Detailed execution

1. Open the workbook and confirm the highlighted input rows and the Validation sheet.
2. Import workflow.json into n8n and inspect the Lab Contract sticky note.
3. Check each node's input/output contract and verify there are no embedded secrets.
4. Insert the bounded prompt below only in the designated AI/tool-adapter node.
5. Run once with approved data and once with a deliberately blocked condition.
6. Retain the final execution evidence and complete the checklist.

Copy-ready bounded prompt

Act as an evidence analyst. For each queued claim, return claim_id, source_id, a concise supported wording, evidence_excerpt under 35 words, limitations and confidence. Never create a citation. Return BLOCKED when no supplied source supports the claim.

Expected workflow path

Manual Trigger -> Research Queue -> HTTP Research Adapter -> Score Evidence -> Claim Coverage Gate -> Save Register

Acceptance criterion

Every factual script claim has an approved source_id; evidence score is at least 0.65; rejected sources remain visible.

Safety and release control

Use synthetic or authorized content. Store credentials in n8n credentials, never in workflow JSON. Human approval must bind to the exact payload hash. Keep publishing dry-run/private until the trainer authorizes a controlled demonstration.
