

Lab 05 - Assemble and Probe the Captioned Vertical Video

Agentic AI for Video Creation | TGS-2023036088 | Version v2.0
Tertiary Infotech Academy Pte Ltd | UEN 201200696W

Objective

Assemble approved or placeholder media with FFmpeg and generate machine-readable technical evidence.

Files and setup

File	Purpose
workflow.json	Importable n8n workflow with dry-run defaults
data/mock-data.xlsx	Synthetic inputs and validation sheet
evidence/checklist.md	Acceptance evidence to retain

Detailed execution

1. Open the workbook and confirm the highlighted input rows and the Validation sheet.
2. Import workflow.json into n8n and inspect the Lab Contract sticky note.
3. Check each node's input/output contract and verify there are no embedded secrets.
4. Insert the bounded prompt below only in the designated AI/tool-adapter node.
5. Run once with approved data and once with a deliberately blocked condition.
6. Retain the final execution evidence and complete the checklist.

Copy-ready bounded prompt

Act as a render-plan validator. Inspect the edit decision rows and return a deterministic FFmpeg plan. Require 1080x1920, 30 fps, H.264 video, AAC audio, yuv420p and exactly 30 seconds. Return BLOCKED for gaps, overlaps or unapproved assets.

Expected workflow path

Manual Trigger -> Approved Asset Manifest -> Build FFmpeg Plan -> Run Assembly Adapter -> FFprobe Master -> Technical Gate

Acceptance criterion

ffprobe reports one H.264 video stream, one AAC audio stream, 1080x1920, 30 fps and duration from 29.5 to 30.5 seconds.

Safety and release control

Use synthetic or authorized content. Store credentials in n8n credentials, never in workflow JSON. Human approval must bind to the exact payload hash. Keep publishing dry-run/private until the trainer authorizes a controlled demonstration.
