

Lab 06 - Run Quality Review and Human-in-the-Loop Approval

Agentic AI for Video Creation | TGS-2023036088 | Version v2.0
Tertiary Infotech Academy Pte Ltd | UEN 201200696W

Objective

Evaluate technical, narrative, brand and compliance evidence, repair one finding and bind approval to the final payload hash.

Files and setup

File	Purpose
workflow.json	Importable n8n workflow with dry-run defaults
data/mock-data.xlsx	Synthetic inputs and validation sheet
evidence/checklist.md	Acceptance evidence to retain

Detailed execution

1. Open the workbook and confirm the highlighted input rows and the Validation sheet.
2. Import workflow.json into n8n and inspect the Lab Contract sticky note.
3. Check each node's input/output contract and verify there are no embedded secrets.
4. Insert the bounded prompt below only in the designated AI/tool-adapter node.
5. Run once with approved data and once with a deliberately blocked condition.
6. Retain the final execution evidence and complete the checklist.

Copy-ready bounded prompt

Act as an independent video reviewer. Return timecoded findings for storytelling, technical compliance, captions, brand, rights and disclosure. Do not approve. After repairs, create an approval request with payload_hash and require a named human decision of APPROVE, REVISE or REJECT.

Expected workflow path

Manual Trigger -> QA Evidence -> Score Review -> Create Approval Hash -> Wait for Human Decision -> Verify Hash and Route

Acceptance criterion

No high-severity finding remains open; reviewer, timestamp, decision and payload_hash are recorded; the hash is rechecked immediately before release.

Safety and release control

Use synthetic or authorized content. Store credentials in n8n credentials, never in workflow JSON. Human approval must bind to the exact payload hash. Keep publishing dry-run/private until the trainer authorizes a controlled demonstration.
