

Lab 08 - Analyse Performance and Build the Scaling Control Plan

Agentic AI for Video Creation | TGS-2023036088 | Version v2.0
Tertiary Infotech Academy Pte Ltd | UEN 201200696W

Objective

Join synthetic platform performance to storyboard beats, identify one repair hypothesis and make a controlled scale decision.

Files and setup

File	Purpose
workflow.json	Importable n8n workflow with dry-run defaults
data/mock-data.xlsx	Synthetic inputs and validation sheet
evidence/checklist.md	Acceptance evidence to retain

Detailed execution

1. Open the workbook and confirm the highlighted input rows and the Validation sheet.
2. Import workflow.json into n8n and inspect the Lab Contract sticky note.
3. Check each node's input/output contract and verify there are no embedded secrets.
4. Insert the bounded prompt below only in the designated AI/tool-adaptor node.
5. Run once with approved data and once with a deliberately blocked condition.
6. Retain the final execution evidence and complete the checklist.

Copy-ready bounded prompt

Act as a video performance analyst. Calculate 3-second hold, average percentage viewed and CTA rate from supplied synthetic rows. Link the largest retention drop to a storyboard beat, propose one testable edit, define a guardrail and recommend HOLD, ITERATE or SCALE. Do not claim causality.

Expected workflow path

Manual Trigger -> Performance Events -> Normalize Metrics -> Join Storyboard Beats -> Score Experiment -> Human Scale Decision

Acceptance criterion

Metrics reconcile to source rows, the hypothesis names one beat and one change, and a human owner records the final HOLD/ITERATE/SCALE decision.

Safety and release control

Use synthetic or authorized content. Store credentials in n8n credentials, never in workflow JSON. Human approval must bind to the exact payload hash. Keep publishing dry-run/private until the trainer authorizes a controlled demonstration.
